Space Communications Office
ICNS Conference
April 2004

Glenn Research Center

at Lewis Field

Oceanic CNS Issues

- No radar/communications infrastructure
- Large, mandatory, procedural separations
- Projected increase in traffic load
- Limited expansion capacity

Oceanic Situational Awareness for the North Atlantic Corridor

Oceanic CNS Amelioration

- Provide CNS “infrastructure” via AMSS
- Deliver timely surveillance information
- Shrink mandatory separations based on improved CNS
- Accommodate traffic expansion

Oceanic Situational Awareness for the North Atlantic Corridor

QUESTION:

How do we model this?

Oceanic Situational Awareness for the North Atlantic Corridor

North Atlantic Flight Information Region

Oceanic Situational Awareness for the North Atlantic Corridor

Maximum Geometrical Corridor Capacity

– 60 NMi Separation	314
– 45 NMi Separation	546
– 30 NMi Separation	1197
– 15 NMi Separation	4674

Oceanic Situational Awareness for the North Atlantic Corridor

AMSS Link Budget Assumptions (Iridium Like)

- 8° minimum elevation angle
- 42.43 W average transmitter power
- 3dB of additional losses
- QPSK modulation
- 1e-9 BER
- Zenith Distance of 780 km
- Horizon Distance of 2460 km
- Frequency of 1.623 GHz
- Satellite G/T of -16.315 dB/K
- Burst Data Rate of 50 kbps

System Refresh Period

- The amount of time that is required for all of the aircraft in the corridor to transmit their messages, one time.
- For aircraft separation reductions to occur safely, all aircraft in the corridor must transmit their position information within the maximum system refresh period.

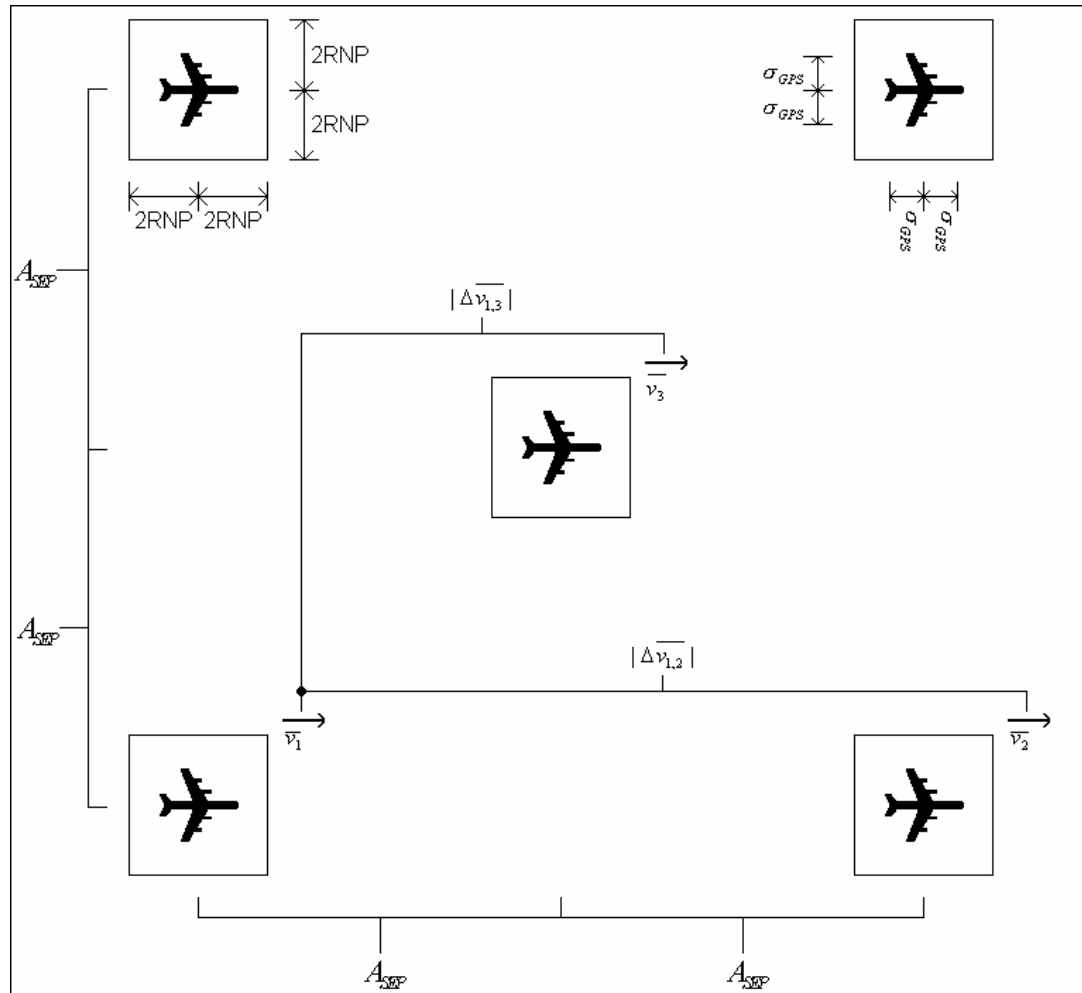

System Refresh Period Factors

- Required Navigation Performance (RNP) to aircraft separation ratio
- Latency (delay from transmission to reception) of position message from aircraft to ATC
- Latency of warning message from ATC to aircraft
- Pilot and aircraft response delay from warning message reception at aircraft to aircraft separation stabilization
- Average aircraft speed
- Speed deviation between aircraft
- Standard deviation for GPS reported position
- Aircraft are not flying on the same path in opposite directions
- Aircraft will not arbitrarily change altitudes

Transmission Methods

- Method 1 – Single Aircraft Transmission at a Time
 - Case 1 – Own Data Transmission
 - Case 2 – Vicinity Data Transmission
- Method 2 – Maximum Aircraft Transmission at a Time
 - Case 1 – Own Data Transmission
 - Case 2 – Vicinity Data Transmission

8	314	546	1197	1248
10	314	546	1197	1520
12	314	546	1197	1788

Oceanic Situational Awareness for the North Atlantic Corridor

Summary

- On a theoretical level:
 - Several AMSS/ADS methods show potential
 - Communications capacity can meet requirements
 - Sufficient surveillance data can be provided
- Taking all that into account:
 - Reduced separations might be considered, but level of separation will depend strongly on procedures
